

Intraoperative Neurophysiological monitoring

Intraoperative neurophysiological monitoring (IOM) is now an integral part of many surgical procedures. It has been utilized in an attempt to minimize neurological damage during surgery, to identify important neural structures in the operative field, and thus to avoid and/or limit significant postoperative impairments. IOM employs a wide variety of physiological principles, each with a very special application, often being used together in the same surgery. These modalities include motor evoked potentials (MEPs), somatosensory evoked potentials (SSEPs), electroencephalography (EEG), electromyography, brainstem auditory evoked potentials (BAEPs), and visual evoked potentials (VEPs)

REGISTRATION

Please register on email address mentioned below.

Total 50 participants will be registered for the CME on first come, first serve basis.

There is no registration fee but prior registration is mandatory. Spot registrations will not be entertained.

Last Date of Registration is 14th November 2018.

Participants have to arrange for their own accommodation.
