DENTAL SEALANT PROGRAM

Department of Dentistry, AIIMS- Bhopal

Department of Dentistry, is organizing a **2 month sealant program** for children from **25th April to 25th June, 2018**. Pits and fissures are the deep grooves that make up the chewing surfaces of your teeth. It's hard to reach in these areas with your toothbrush, so food and bacteria can accumulate in the pits & fissures and lead to dental caries/cavity formation.

Fissure sealants are material designed to be placed on the pit and fissures of molar teeth to prevent the development of dental caries. Fissure sealants have great potential as a preventive measure and reduce dental caries upto 40% -60%.
